

WorldReady — Localization Style Guide

Galaxium Travels · English → French (Quebec) + Arabic (RTL) · authored by Claude Code (P03)

1 · French for Quebec (fr-CA)

- **Register:** address the user with « **vous** », never « tu ». Keep it professional and concise.
- **Currency:** format money as **Canadian dollars (CAD)** in fr-CA, e.g. `1 200,00 $ CA` — comma decimal, space thousands, symbol after the number. Use `Intl.NumberFormat('fr-CA', { style: 'currency', currency: 'CAD' })`; never hard-code `en-US / USD`.
- **Dates & numbers:** day-month-year (`1 juin 2025`), 24-hour clock, comma decimal, space as thousands separator. Localize month names via a date-fns `fr` locale — never English month abbreviations.
- **Quebec terminology:** use **courriel** (not « e-mail »), **clavardage** (chat), **téléverser** (upload). See the glossary for domain terms (vol, réservation, place, devis).
- **Spacing:** French uses a non-breaking space before `:` `;` `!` `?` and inside « guillemets ».
- **Why it matters:** Quebec's Bill 96 / Law 14 has required French commercial web content since **1 June 2025**, with fines of **\$3,000–\$30,000 per violation**.

3 · Engineering rules (all languages)

Never concatenate translated fragments

- ✗ `"Showing " + n + " flight" + (n!==1?"s":"")` — word order and plurals differ per language.
- ✓ `t('flights.count', { count: n })` with i18next plural keys (`_one` , `_other` , and for Arabic `_zero/_two/_few/_many`).

Keep placeholders & markup intact

- Preserve every `{{name}}` / `{{count}}` and `<0>...</0>` tag exactly — do not translate, reorder-break, or delete them. Translators may move a placeholder within the sentence but must keep it verbatim.
- Numbers, dates and currency come from `Intl` keyed to the active language — not from the translation string.

String length limits

- Translations run **up to ~30% longer** than English (French especially). Keep button/label copy tight; test with the **pseudo-locale** (`[[...]]`, +30%) to catch clipping before shipping.
- Respect the `max length` column in the translator spreadsheet for constrained UI (buttons, chips, nav).

2 · Arabic (ar) — right-to-left

- **Direction:** the whole UI mirrors. Set `<html dir="rtl" lang="ar">` (via `document.documentElement.dir = i18n.dir()`) and use logical CSS: `ms-/me-`, `ps-/pe-`, `start-/end-` instead of `ml-/mr-`, `pl-/pr-`, `left-/right-`.
- **Mirrored icons:** directional icons (back arrows, chevrons, progress) must flip: `rtl:-scale-x-100` or swap `ArrowLeft` ↔ `ArrowRight`. Non-directional icons (rocket, user, clock) stay as-is.
- **Digits:** use **Western/Latin digits** (0-9), not Eastern-Arabic (٠-٩), for prices and counts — match the product's market convention via `Intl.NumberFormat('ar', { numberingSystem: 'latn' })`.
- **Currency & dates:** format through `Intl` keyed to `ar`; keep the currency the market expects (USD/CAD per business rule). Localize month names with a date-fns Arabic locale.
- **Plurals:** Arabic has **six** plural forms — `zero`, `one`, `two`, `few`, `many`, `other`. Every countable string needs all six `i18next` keys; the key-parity checker enforces this.
- **Brand names & planet values:** keep **Galaxium** and other brand terms in Latin script (allow-listed). Translate planet *labels* (المريخ) but keep the English value (`Mars`) as the search/filter value.
- **Punctuation:** use Arabic comma (,) and question mark (?) where natural.

Quality note: machine drafts are for native review. This guide governs structure, formatting, placeholders and layout — not literary polish. Flag anything a native reviewer must confirm in the translator spreadsheet's *reviewer note* column.

Example (RTL)

English	Arabic (label)
Available Flights	الرحلات المتاحة
{{count}} seats left	{{count}} مقاعد متبقية
Book a Flight	احجز رحلة
